Abstract of the disclosure

[Abstract]

A bowling automatic scoring system so far provided an excitor by animated graphics just for the display of the bowling result when strike or spare are detected, but this invention is to display an excitor of a non-animated, video recorded actual person.

This invention is a CM Auto-Scorer for advertisements and sales promotion of sponsors which displays bowling results for a bowling game in a bowling center by an excitor of a non-animated, video recorded actual person with sound and automatically judges if a bowler goes beyond a given standard by frequency of excitors, by types of excitors, and/or by displayed frames.
